Internal Operations · AWS Deployment Guide

How to Deploy Updates to Production

Follow these steps every time you push a code change and want it live on **docrud.com**.

1

AWS CONSOLE

Log in to AWS

Open **aws.amazon.com** and click *Sign in to the Console*.

Choose **Root user** and enter the registered root email address, then the password.

Use root login credentials (keep these secure — do not share).

2

REGION

Select Europe (Stockholm) Region

In the top-right corner of the AWS Console, click the region dropdown and select **Europe (Stockholm) — eu-north-1**.

3

EC2

Go to EC2 → Instances

In the search bar type **EC2** and open it. From the left sidebar click **Instances**.

Find the instance named **docrud** and select it.

4

CONNECT

Connect via EC2 Instance Connect

With the instance selected, click the **Connect** button at the top. Choose the **EC2 Instance Connect** tab and click **Connect**.

A browser terminal will open directly — no SSH key needed.

5

TERMINAL

Navigate to the Project

In the terminal, run:

```
cd ~/docrud
```

6

TERMINAL

Pull Latest Code from GitHub

Fetch and apply the latest changes from the `main` branch:

```
git fetch origin  
git reset --hard origin/main
```

7

TERMINAL

Build the App

Compile the Next.js application. This takes 2–5 minutes:

```
npm install  
npm run build
```

Wait for "✓ Compiled successfully" before moving to the next step.

8

TERMINAL

Restart the App with PM2

Apply the new build and restart the running server:

```
pm2 restart all
```

Verify the app is running:

```
pm2 status
```

Status should show **online**. The site is now live at docrud.com.
